9 development process is permitted without prior permission, neither this document nor any extract from
10 it may be reproduced, stored or transmitted in any form for any other purpose without prior written
11 permission from the IWSFG.

12 Once finalized, the IWSFG will permit the downloading and use of the documents without charge for
13 the purposes of determining whether or not a product is likely to be considered flushable and to be so
14 identified.

15 **Forward**

The International Wastewater Services Flushability Group (IWSFG) is a worldwide coalition of national and regional wastewater services' Associations and Organizations and individual wastewater services.

The work of preparing the standards is carried out by various drafting groups comprising volunteers designated by the principal and the supporting participants of the group. They participate on a voluntary basis, without remuneration of any kind.

The criteria for flushability and the test methods are the product of a global consensus of the coalition members and reflect the hydraulic, mechanical and environmental conditions of drain lines, various onsite treatment systems, and wastewater collection and treatment systems as well as the receiving waters for treatment plant effluents.

The task of the group was to prepare standards reflecting the above purpose.

Wastewater services are organizations acting for the public good as a public service. The group expects the manufacturers and distributors of their products to act in a socially responsible and environmentally sustainable manner by adhering to the established standards.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. The IWSFG shall not be held responsible for identifying any or all such patent rights.

76

77 1 Introduction

78 Wastewater process systems are designed to receive, treat, and convey sanitary discharges¹ that, after
79 treatment, are subsequently disposed of as:

- 80 a. liquid effluents to the aquatic environments of lakes, rivers, and oceans
- 81 b. solid residuals (biosolids) for application to land for their inherent nutrient values
- 82 c. solid residuals incinerated or digested for energy recovery, or as
- 83 d. solid residuals sent to landfill

84 Typical waste streams include toilet paper, human waste, food waste, detergents and cleaning agents. In
85 recent years, new products such as moist wipes and toilet bowl cleaning products have been introduced
86 worldwide – many of these are identified as “flushable” products. Other products such as tampons,
87 condoms, facial tissues are commonly but inappropriately flushed. The physically adverse effects of such
88 products on wastewater systems (clogging and plugging) have been identified but other numerous
89 environmental effects have not been studied systematically. For example, various flushed products may
90 comprise materials and chemicals that can be harmful to the environment; hence, such products should
91 not be identified as “flushable”. Accordingly, the purpose of the flushability test, along with others
92 presented in this IWSFG series, is to define the qualities and characteristics of those products that may
93 be considered to be “flushable”. By adhering to these test methods and providing the appropriate
94 advice to the product users regarding the after use disposal of such products will ultimately lead to the
95 long-term sustainability of the wastewater systems and the minimization of potential problems such as
96 pipe blockages and equipment failures in sewer networks.

97 The goal of the IWSFG is not to ban the production and/or use of these products, but to encourage
98 manufacturers to identify those products that do not meet the established IWSFG standards as not
99 being “flushable” and to encourage users to dispose of the products after use in a more appropriate
100 manner.

101 2 Purpose

102 The purpose of this test is to assess the performance, i.e. drain line clearance under snagging conditions,
103 of a product when it is subjected to the hydraulic forces typically found under intermittent flow
104 conditions in wastewater transport systems.

105 The test will demonstrate the potential of a product to pass through a simulated residential sanitary
106 sewer pipe system (drain line) with a snagging obstruction under normal gravitational flow. The
107 obstruction is simulated by either a misaligned pipe joint, a root intrusion, or burrs, which are commonly

¹ In some instances, by agreement with a commercial or industrial client, a wastewater utility may agree to accept discharges containing chemicals or other contaminants not normally found in sanitary discharges. Acceptance is by specific agreement that such chemicals or contaminants can be safely treated through the treatment processes of the wastewater utility. Otherwise pretreatment by the commercial or industrial organization is required to bring the discharge into conformity with the established acceptable standards.

108 found in cut and re-assembled pipe. The test method determines the likelihood that an article, if flushed
109 into a drain line with an uneven interior surface, will successfully clear the drain line.

110 3 Scope

111 The scope of this PAS includes all products that a manufacturer or distributor may wish to identify as
112 being flushable and all products, which by the location of their use and likely contamination by human
113 excreta, are likely to be flushed through a toilet into a drain line and wastewater conveyance and
114 treatment system.

126 Annex 7 – Dry Mass Calculation Worksheet

127 5 Terms and Definitions

128 Refer to IWSFG PAS 0:2017 except for unit size (See 5.1 & 5.2).

129 5.1 Unit Size – Dry Tissues

130 For dry tissues, which are not toilet paper, the unit size is 2 tissues as removed from the
131 packaging.

132 5.2 Unit Size – Toilet Paper

133 For toilet paper, the unit size shall be a number of multiple joined sheets (typically 6)
134 folded into a square as shown in Figure 1 below. The target mass for a unit size is 3 g.

Figure 1 - Folding of Toilet Tissue into a “Unit Size” [2]

5.3 Unit Size – Moist Tissues

For moist tissues, the unit size is one tissue or the maximum number of the product that may be flushed according to the manufacturer’s instructions or recommendations contained on the packaging.

5.4 Unit Size – Other Products

For other products, the unit size is one product or the maximum number of units of the product that may be flushed according to the manufacturer’s instructions or the recommendations provided on the packaging.

6 Principles

The flushability test is used to demonstrate a product’s potential to successfully exit a drain line with simulated snags when subjected to the hydraulic forces normally found in a gravity fed intermittent flow situation.

This test provides evidence to determine if a product will first tear and then exit a drain line with simulated snags when subjected to a set number of toilet flushes.

The testers acknowledge that many buildings do not have perfectly constructed drain lines. This testing is to replicate the typical property connections with snagging obstructions such as an offset pipe joint and/or an abrasive pipe material (e.g. cast iron, concrete, a globule of vitrified clay, etc.).

It is recommended that the toilet bowl clearance test and drain line snagging test be evaluated simultaneously, using identical product/product loading.

Note: The test is undertaken in potable water, as opposed to wastewater because:

- a. It avoids the health and safety issues associated with wastewater.

- 161 b. It avoids the inconsistencies that would inevitably be found between two or more samples
162 of wastewater.

163

164 7 Apparatus

165 The drain line and toilet comprise a:

- 166 a. 4.5 L ± 0.4 L siphonic toilet as in IWSFG PAS 2A: 2017 Toilet Clearance Test
167 b. 3 m long ABS 76 mm (3 in) vented sewer pipe connection to the drain line with two 90°
168 horizontal bends
169 c. 20 m long PVC drain line 10 cm (4 in) constructed of joined pipe sections of approximately 2.5
170 m, firmly mounted on a series of trestles such that there is a continuous slope of 2°
171 d. drain line containing one 90° horizontal corner 5 m from the head end
172 e. three common galvanized self-tapping screws

173 (See: Photo A.1 – Toilet and Drain Line Set Up)

174 Optional equipment:

- 175 a. Suitable containers (e.g. plastic bucket) to:
176 1. transfer the test material from the toilet used for Toilet Clearance Test to the drain line, or
177 2. capture the liquid exiting the drain line during the test
178
179

180

181 8 Preparation

182 8.1 Sample Acquisition

183 For products already in the market place, the testing laboratory shall select and acquire
184 sample products from retail outlets (e.g., grocery stores or pharmacies).

185 For products under development as new or improved products, the testing Laboratory
186 may receive samples from their manufacturers or the intended distributors.

187 The test report shall clearly indicate the applicable method of sample acquisition
188 procedure or purpose.

189

190 8.2 Number of Test Pieces

191 Ten specimens are required for each complete testing.² Specimens should be obtained
192 from at least two distinctly separate packages of a product. To obtain 10 specimens, a

² Note: in order to prepare for the possibility that the alternate dry weight test verification is needed, 10 additional specimens should be acquired.

193 roll of toilet paper, or a bundle of wipes in its original package should be divided into 5
194 equal sections. Then, one specimen from each section will be used for testing.

195 For toilet papers, the starting point, as well as, the end point of a toilet paper roll should
196 be avoided due to the glue effect.

197 To obtain moist tissue specimens, it will be convenient to turn their packaging on its side
198 to see the whole bundle of moist tissues. Then, the packaging will be divided into 5
199 equal sections, and a specimen will be removed from each section.

200 Caution is necessary in order to not damage delicate specimens when removing them
201 from the package. Specimens must be removed immediately before testing begins.

202

203 8.3.1 Dry Tissues

204 The specimen shall comprise one unit of toilet paper or one unit of dry tissues.

205

206 8.3.2 Moist Tissues

207 The specimen shall comprise one unit of moist tissues, which is taken directly from the
208 packaging, unless the manufacturer's instructions recommend a maximum number, in
209 which case the maximum loading per flush suggested by the manufacturer should be
210 used and recorded in the test report.

211 Moist tissues shall be tested as they are removed from the package. No attempt to remove the
212 lotion should be made and the removed moist tissue should be tested immediately, to reduce
213 the amount of evaporation of the moisture.

214

215 8.3.3 Other Products

216 For other products, one specimen only should be taken directly from the package

217

218 8.4 Apparatus

219 The following configuration shall apply:

- 220
- 221 a. The maximum vertical distance from the toilet outlet to the horizontal drain line
222 beneath it should not exceed 40 cm (16 in).
 - 223 b. The line should be vented near the toilet to prevent the development of a
224 vacuum in the line.
 - 225 c. Each section of the drain line should be held in place by using adjustable
226 supports or by laying the pipe on a bed of sharp sand.
 - 227 d. The support system must be established and maintained to prevent sagging at
the joints.

- 228 e. To ensure the accurate positioning of the drain line, it is recommended that the
229 slope of each individual pipe be measured.
230 f. Along the drain line's length, distances are marked at regular intervals (0.5
231 meters) to allow for the quick measurement and recording of the location of the
232 flushed articles relative to the toilet after each flush.
233 g. A screen or other device should be used at the terminal end of the drain line to
234 recover the flushed articles during testing.

235 Photographs of a typical test system can be found in Annex 2.

236 Replicating the snagging obstruction requires that:

- 237 a. Three common galvanized self-tapping screws should be drilled into the flow path
238 in the bottom surface of the drain line.
239 b. Screws should penetrate the pipe and extend 12 mm above the bottom surface.
240 c. The snags shall be positioned in the 10 cm PVC pipe:
241 • 4 m from the toilet
242 • 12 m from the toilet
243 • 1 m from the discharge point.

244 Approximately 1 m of the upper 1/3rd of the drain line should be removed above the location of
245 the snags in order to facilitate the clearance of any snagged material, which was not successfully
246 removed by the flushing actions.

247 (See: Photo A.2: Galvanized Screws as Snagging Obstruction)

248

249 In the set-up and prior to conducting a test, the drain line and the snags should be checked to
250 ensure that all are clear of residual materials from previous tests (See: Photo A.4).

251 Three flush actions should be performed without a specimen and the flushed material should be
252 collected for measurement to establish a baseline flush for the drain line and to ensure the
253 correct operation of the system. The average of the three flush actions should be 4.5 L ± 0.4 L.

254 Prior to initiating each test flush, ensure that the drain line has no flow.

255 From time to time, confirm that the average slope in the drain line is 2%.

256 9 Storage and Conditioning

257 9.1 Storage of Samples

258 Samples shall be stored under ambient laboratory conditions in the manufacturer's
259 original packaging.

260 If the samples have been removed from the manufacturer's original packaging, they
261 shall be identified and stored as follows:

- 262 1. Dry products should be returned to their original packaging, and should be

- 263 double-bagged with resealable plastic bags.
264 2. Moist products should be returned to their original packaging, e.g., hard-plastic
265 containers or soft-plastic packages.
266 3. In case of hard-plastic boxes, the box should be re-closed, and then it should be
267 double-bagged with plastic resealable plastic bags to minimize any exposure to
268 the ambient air.
269 4. Soft-plastic packages should be closed tightly after squeezing the air out of the
270 package, and then they should be double-bagged with resealable plastic bags to
271 minimize the potential exposure to ambient air.
272 5. Samples then should be stored in secured laboratory cabinets.

273 9.2 Conditioning for the Test

274

275 The specimens shall be first conditioned by applying the IWSFG PAS 2A – *Toilet*
276 Clearance Test Method.

277

278 10 Procedure

279 10.1 Summary

280 The test consists of conducting 10 toilet flush sequences with the test product, using
281 loading levels provided by the manufacturer's instructions or anticipated usage. After
282 each flush, observations are made regarding whether the specimen has cleared the
283 toilet bowl and trap.

284 Following each flush, the location of the specimen in the drain line is recorded.

285 10.2 Test procedure

286 The following steps should be undertaken:

- 287 1. Prior to adding any articles to the toilet or initiating a flush ensure that there
288 is no flow in the drain line toilet.
289 **Note:** This does not mean that the drain line should be dry.
290 2. If the drain line is not connected to a toilet, pour the specimen specified in
291 Section 6 along with 4.5 L ± 0.4 L of water into a funnel at the upper end of
292 the drain line, or
293 3. If the drain line is connected to the toilet used in the IWSFG PAS 2A Toilet
294 Clearance Test, simply flush the toilet in conformity with the procedure
295 followed in that test.
296 4. After the initial flush action, inspect the drain line to determine if the
297 specimen has cleared the drain line, or to determine where the specimen is
298 located in the drain line, i.e. is it caught on a snag. Then record the location of
299 the test product and take a photograph.

- 300
- 301
- 302
- 303
- 304
- 305
- 306
- 307
- 308
- 309
- 310
- 311
5. Repeat the flush action after 5 minutes either by pouring $4.5 \text{ L} \pm 0.4 \text{ L}$ of water into the funnel, or by flushing the toilet again. Inspect the drain line to determine where the test article is located. If visible, record the location of the product and take a photograph.
 6. Repeat steps 2 to 4 a maximum of 5 times to verify the location of the test article in the drain line if it is visible. Record the location of the product and take a photograph.
 7. Record the outcome (observations) according to Table 1.
 8. Repeat the test sequence a total of 10 times to complete the test. Ten specimens of the acquired test product must be tested sequentially and completed with the results being logged.

DRAFT

312

313

Table 1: Procedures to Follow after Each Flush Based on Observations of Toilet and Drain-line

314

Observation	Procedures to Follow
Record the location of the specimen in the drain line following the 1 st flush.	<ol style="list-style-type: none"> 1. Determine if the specimen is visible and if it has exited the drain line or has become attached to a snag. If attached to a snag, take a photograph. 2. Allow 3 minutes for the water and the flushed articles to equilibrate within the drain line. 3. Unless the flushed specimen has exited the drain line, continue with the next flush in the sequence.
Record the location of the specimen in the drain line following the 2 nd flush.	<ol style="list-style-type: none"> 1. Determine if the specimen is visible and if it has exited the drain line or become attached to the snag. If snagged, identify the snag number and take a photograph. 2. If snagged, determine if the specimen is beginning to shear (tear) or has sheared and has continued beyond the snag. 3. Allow 3 minutes for the water and the flushed specimen to equilibrate within the drain line. 4. Unless the flushed specimen has exited the drain line, continue with the next flush in the sequence.
Record the location of the specimen in the drain line following the 3 rd flush.	<ol style="list-style-type: none"> 1. Determine if the specimen is visible and if it has exited the drain line or become attached to the snag. If snagged, identify the snag number and take a photograph. 2. If snagged, determine if the specimen is beginning to shear (tear) or has sheared and continued beyond the snag. 3. Allow 3 minutes for the water and the flushed specimen to equilibrate within the drain line. 4. Unless the flushed specimen has exited the drain line, continue with the next flush in the sequence.
Record the location of the specimen in the drain line following the 4 th flush.	<ol style="list-style-type: none"> 1. Determine if the specimen is visible and if it has exited the drain line or become attached to the snag. If snagged, identify the snag number and take a photograph. 2. If snagged, determine if the specimen is beginning to shear (tear) or has sheared and continued beyond the snag.

Observation	Procedures to Follow
	<ol style="list-style-type: none"> 3. Allow 3 minutes for the water and the flushed specimen to equilibrate within the drain line. 4. Unless the flushed specimen has exited the drain line, continue with the next flush in the sequence.
Record the location of the specimen in the drain line following the 5 th flush.	<ol style="list-style-type: none"> 1. Determine if the specimen is visible and if it has exited the drain line or become attached to the snag. If snagged, identify the snag number and take a photograph. 2. If snagged, determine if the specimen is beginning to shear (tear) or has sheared and continued beyond the snag. 3. Terminate the test.

315

316

10.3 Test Termination

317

318

Upon completion of a round of testing, the drain line shall be drained and cleared of any residues from the specimens.

319

320

In cases where the specimens contain fiber-binding chemicals that are likely to remain on the walls of the flasks or the sieve surfaces, the flasks and sieve surfaces shall be washed using solvents such as ethanol and methanol, or soap and water.

321

322

323

10.4 Test Results

324

The test must be repeated with 10 specimens.

325

a. If 8 or more of the 10 tested specimens show no residual fragments remaining on the 6.3 mm sieve after rinsing, the product will pass.

326

327

b. Record the test results for each one of the 10 specimens. Collect any residual fragments that remained on the 6.3 mm sieve during each test.

328

329

Quantify the dry-mass of all the residual fragments from the 10 specimens

330

by drying the fragments at 103 °C for 4 to 8 hours. For a product to pass

331

the test, the total dry-mass of all residual fragments (>6.3 mm solids) must

332

be less than 5 % of the initial dry mass of the 10 samples.

333

334

(See Annexes 3, 4, 5 and 6 for the procedure to be followed for the dry mass measurement.)

335

336

337

10.4 Calculations

338

The following calculations are required:

339

340 The percentage of the 10 tests in which the specimens exited the drain line
341 in 5 or less flush actions without snagging, and
342

343 • The percentage of the ten specimens' mass that did not snag
344 (operationally defined as observed residual pieces or torn sections
345 caught on the snags) is calculated using the following equation:
346

$$\% \text{ Disintegration} = \left[1 - \frac{\text{total dry mass of retained fraction in sieve (g)}}{\text{total initial dry mass of sample (g)}} \right] \times 100$$

347
348
349
350
351

(See Annexes 4, 5, and 6 for procedures to be followed.)

352 11 Acceptance Criteria

353 To be acceptable:

- 354 a. All ten specimens in a test sequence of the five flushes must clear the drain line.
355 b. Where residual pieces or torn sections of the specimens are observed on one or more
356 snags, the specimen will be considered to pass the test provided that the collected
357 pieces or torn sections constitute no more than 5% of the starting dry mass of the ten
358 specimens when measured according to the procedures found in Annexes 4, 5, and 6.

359 12 Test Report

360 The test report should include the following information:

- 361 1. a reference to this test procedure
362 2. an overview of the test procedure including the drain line configuration
363 3. the date and location of testing
364 4. the complete identification of the tested product
365 5. a statement as to the acquisition process followed and the purpose of the testing
366 6. the dimensions and weights of all the specimens
367 7. the number of specimens used per flush
368 8. a description of any departure from the established procedure and any circumstances that may
369 have affected the results along with an explanation
370 9. confirmation of the average number of flush actions performed in the test sequence
371 10. copies of the photographs taken during the procedure
372 11. the test results, including:
373 a. the details of each test, in terms of distance travelled after each flush and number of
374 flushes required to exit the drain line
375 b. the average number of flushes needed for the specimens to exit the drain line

- 376 c. the percentage of the 5 tests in which the specimens did not exit the drain line
377 d. the percentage of the dry weight of the test specimens that remained caught on the snags
378 e. a statement indicating whether the product passed or failed the test.
379

380 13 Precision

381 Periodically the toilets used should be checked for their correct operation (flapper/check valve, fill line)
382 and their delivery of the correct flush volume. When required, they should be adjusted to meet the
383 manufacturer's specifications.

384 The drain lines used should be checked periodically for correct alignment; adjustments should be made
385 to assure a continuous slope of 2% if necessary.

386 Periodically the snags in the drain line should be verified for having a 12 mm protuberance.

387 There may be some variation in the quality of the products being tested, which is why 5 separate
388 specimens shall be acquired, according to Section 8.1.

401

Annex 1 – Sources of Apparatus

402

(Informative)

403

All of the apparatus required for this test is readily available in hardware and plumbing outlets.

404

It is recommended that drain lines used be certified as conforming to applicable national standards.

405

The mounting platform for the drain lines can be constructed using readily available lumber.

419

420 Annex 4 - Procedure for Pre-rinsing Test Products for Determining Initial 421 Dry Mass 422 (Informative)

423

424 A.4.1 Introduction

425

426 This Annex describes two approaches for pre-rinsing the test
427 products to remove water soluble lotions or other additives from
428 the test products before using them in the determination of the
429 initial dry mass. The first method, which is recommended, involves
430 flushing the products down a toilet and through a drain-line using tap
431 water. This approach simulates the actual rinsing process that occurs
432 when a product is flushed on its way to a wastewater conveyance
433 system. When a toilet and drain-line is not available, an alternative
434 method can be used that involves swirling the products in a
435 container of tap water.

436

437 A.4.2 Test Product Selection

438

439 When conducting a test to support a flushable claim, the products used
440 for testing must be the same as those offered in the intended market.

441 It is necessary to obtain a sufficient number of products (articles) to
442 conduct the intended test.

443 If there is a need to determine the average dry weight for the product, at
444 least 10 more articles will be required, and when the products exhibit a
445 high variability in their weights, more articles may be needed.

446 Test articles should be randomly obtained from different sections of one
447 or more packages to ensure that they are broadly representative. This is
448 particularly important for products such as wipes, which are packaged in a
449 roll or stack.

450

451

452 A.4.3 Toilet and Drain Line Method

453

454 A.4.3.1 Equipment

455

- 456
- Use a toilet and Drain-line as per PAS 2A, with catch basket positioned before the drain.
- 457
- 458
- It is recommended to use a toilet with at least a 4.5 L ± 0.4 L flush volume.
- 459

460
461

A.4.3.2 Procedure

- 462
- Prior to adding any materials to the toilet bowl or initiating a flush, ensure that the toilet has stopped running and the water in the bowl is at a normal level.
 - When adding a product (e.g. hygienic wipe) place it in the center of the toilet bowl and allow sufficient time, typically 15 seconds, for it to become fully saturated with water before adding another product or flushing the toilet.
 - No more than 2 wipes should be flushed at one time.
 - **Retrieve** the products before they enter the basket or as soon as it is practically possible to prevent any disintegration of the product caused by water flowing out of the pipe.
 - When necessary, use additional flushes without a product to move products out of the drain-line for collection.

A.4.4 Alternative Method

479
480

A.4.4.1 Equipment

- Containers with a capacity of approximately 20 L (5-gallons)
- 481
482
483

A.4.4.2 Procedure

- Fill the containers with tap water.
 - Submerge the products in the water and swirl them for approximately 30 seconds, or longer if necessary, to remove any residual lotion or additives.
 - To maintain the ratio of water to product existing in the toilet and drain-line described above, no more 6 units of a product should be placed at one time in a

493 single container containing 20 L of tap water.

494

495 Annex 5 - Recovery of Product Residues 496 (Informative)

497 A.5.1 Introduction

498

499 This Annex describes the recovery and rinsing procedures of the product residues following
500 the snagging tests. Once the samples are transferred to a sieve, these procedures are
501 used to rinse small materials and to recover the residues for gravimetric analysis.

502

503

504 A.5.2 Equipment

505

- 506 • Peerless shower head Model 76114WH
507 with hose assembly (pictured at right),
508 or similar device, attached to a faucet
509 (tap) with a graduated flow regulator
510 adjusted to deliver 4L per minute
- 511 • 4 L beaker (recommended)
- 512 • stopwatch or other timing device
- 513 • fine mesh hand sieve
- 514 • forceps
- 515 • drying pans

516

517 Source: IWSFG Member.

518

519 A.5.3 Procedure

520

- 521 1. Turn the faucet on and adjust the regulator to a flow rate of 4 L per minute.
- 522 2. The flow rate can be determined by measuring the volume delivered to a suitable
523 container with graduations after a specified time period. For example, it should
524 take exactly 60 seconds to deliver 4 L of water to the 4 L mark on a beaker. Once
525 the flow is adjusted, this measurement should be repeated at least three times
526 and should vary less than 5%.
- 527 3. When transferring the contents from a disintegration test to the sieve, pour the
528 contents of the test vessels slowly while distributing them over the complete
529 surface of the sieve.

- 530 4. With the handheld showerhead spray nozzle held approximately 10-15cm (4-6")
531 above the top surface, gently rinse smaller materials through the sieve.
532 Constantly move the spray over the entire surface without concentrating the
533 spray on any specific areas. Do not force the passage of any material through the
534 sieve.
535 5. After 1 minutes of rinsing, quantitatively recover all the retained materials from
536 both sides of the sieve using forceps or by backwashing the material into a smaller
537 sieve and then using forceps.
538 6. Transfer these materials into labeled drying pans or tared weigh boats to
539 determine their dry weight (see Annex 6).

543 Annex 6 – Drying and Weighing of Products and Product Residues 544 (Informative)

545 A.6.1 Equipment:

- 546
- 547 a. oven capable of maintaining a constant temperature between 40° and 103°C
- 548 b. weighing dishes
- 549 c. forceps
- 550 d. desiccator
- 551 e. analytical balance (reads to 4 decimal places)
- 552 f. 10 specimens
- 553

554 A.6.2 Procedure

555 A.6.2.1 Loss of Mass Calculation Procedure

- 556 1. If there are residual fragments at the end of any of the 10 tests, collect them using the
- 557 procedures described in Annex 5 prior to determining their dry weight.
- 558 2. Set the oven to a temperature appropriate for the chemical and physical properties of the
- 559 specimen – this is typically 103 °.
- 560 3. Place the specimens to be analyzed in an oven-safe weighing dish or on a piece of foil.
- 561 4. In the case of difficult to handle specimen residues, it may be appropriate to place the
- 562 residues in pre-weighed (tared) aluminum weigh boats.
- 563 5. Dry the specimens in the oven for several hours or overnight.
- 564 6. Transfer the specimens from the oven to a desiccator and allow them to cool.
- 565 7. Weigh the specimens and record the weight.
- 566 8. Return the specimens to the oven for approximately 30 minutes and again allow them to
- 567 cool in the desiccator and determine their weight.
- 568 9. Repeat this process as necessary until the specimens reach constant weights.
- 569 10. Record the total weight of residuals from 10 tests.
- 570 11. Calculate the loss of mass using the Loss of Mass worksheet set out in section A.6.4.

571

572 A.6.3.1 Initial Dry Mass Calculation Procedure

- 573 1. Select 10 specimens in accordance with Annex 4, section A.4.3.
- 574 2. Specimens with water soluble lotions or additives should be pre-rinsed using the procedures
- 575 described in Annex 3 prior to determining their dry weight.
- 576 3. Set the oven to a temperature appropriate for the chemical and physical properties of the
- 577 specimen – this is typically 103 °C.
- 578 4. Place the specimens to be analyzed in an oven-safe weighing dish or on a piece of foil.
- 579 5. In the case of difficult to handle specimen residues, it may be appropriate to place the
- 580 residues in a pre-weighed (tared) aluminum weigh boats.
- 581 6. Dry the specimens in the oven for several hours or overnight.
- 582 7. Transfer the specimens from the oven to a desiccator and allow them to cool.
- 583 8. Weigh the specimens and record the total weight.

- 584 9. Return the specimens to the oven for approximately 30 minutes and again allow them to
585 cool in the desiccator and determine their weight.
586 10. Repeat this process as necessary until the specimens reach constant weights.
587 11. Record the total weight of the ten (10) specimens.
588 12. Calculate the loss of mass using the Loss of Mass worksheet set out in A.6.4.
